## Where Egyptian Marble Meets Mastery

## 1. Polished Finish

### Definition:

A polished finish gives the marble a glossy, mirror-like surface. It enhances the stone's color and pattern, making it more vibrant. The surface is smooth and reflective due to fine grinding and buffing.

Use: Commonly used for countertops, floors, and decorative walls.

## 2. Honed Finish

### Definition:

A honed finish is smooth but not shiny. The surface has a matte or satin appearance with little to no reflection. It is achieved by stopping the polishing process before a high gloss develops.

Use: Ideal for floors, staircases, and high-traffic areas due to its slip resistance.

## 3. Brushed Finish

### Definition:

A brushed finish is created by using abrasive brushes to give the marble a worn-in, textured, and slightly matte appearance. It brings out the natural color while softening the surface.

Use: Often used for rustic or antique-style interiors, especially in floors and walls.

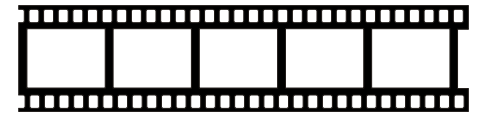

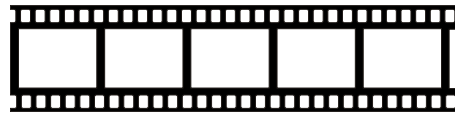

#### 4. Tumbled Finish

##### Definition:

A tumbled finish gives the marble a weathered, aged look with rounded edges and a softer surface. This is done by tumbling the stones with sand, grit, and water.

Use: Common for backsplashes, mosaics, and decorative tiles.

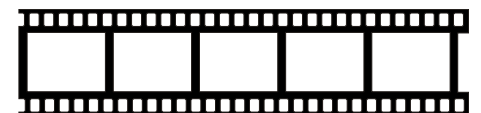

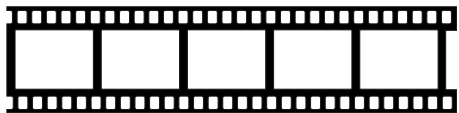

#### 5. Sandblasted Finish

##### Definition:

Sandblasting involves blasting the marble with sand or other abrasive materials to create a rough, textured surface with a slightly faded look.

Use: Used for exterior walls, walkways, and areas where slip resistance is important.

#### 6. Split Face / Rock Face Finish

##### Definition:

A split face finish gives a very rough, uneven surface that mimics natural stone breakage. It creates a rugged and rustic appearance.

Use: Popular for feature walls and exterior facades.

## Acid Washed Finish

A slightly rough, matte surface created by treating marble with acid. It gives an aged, textured look and improves slip resistance.

Common use: outdoor flooring, wet areas.

Delivering the  
elegance of  
Egyptian  
marble to the  
world
